

Notes Pipe behaviours

```
echo Hello World | echo Bye  
echo Hello World >> file1 | echo Bye
```

```
## Bye
```

```
## Bye
```

Notes from these two examples: if you have a pipe, in the first instance: the writing end part of the pipe is not going to output anything the fd 1

On the second instance, it will execute the writing end part of the pipe which means it's going to create "file1", and write "Hello World" in it, and it will print out the second part to fd 1

```
env | echo >> Bye
```
